PRESENTING CLINICAL SIGNS

Decreased appetite, decreased defecation. Overweight, tense, abdomen, no obvious foreign body on x-rays. Cerenia, famotidine, proviable.

2/26/26 Neut 11,054, Mono 752, stress Leuk. All else WNL

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

Urinary bladder is adequately distended. It has a normal uniform wall thickness. Contents include primarily anechoic fluid with a moderate amount of suspended echogenic non-shadowing debris, most consistent with exfoliated cells, mucous and/or small blood clots. Both sterile inflammation as well as urinary tract infection can present with echogenic debris. No masses or cystoliths are observed. The trigone and visible pelvic urethra are normal in thickness with a smooth mucosal surface.

The left kidney presents normal size with normal shape and architecture. Normal corticomedullary distinction. No pyelectasia, ureteral dilation or nephrolithiasis. The left kidney measured 4.8 cm in length.

The right kidney presents normal size with normal shape and architecture. Normal corticomedullary distinction. No pyelectasia, ureteral dilation or nephrolithiasis. The right kidney measured 5.4 cm in length.

Adrenal Glands

The left adrenal gland presents normal shape and homogenous parenchyma. The phrenic vasculature is unremarkable. The cranial pole measures 4.0 mm and the caudal pole measures 3.6 mm.

The right adrenal gland presents normal shape and homogenous parenchyma. The phrenic vasculature is unremarkable. The cranial pole measures 5.7 mm and the caudal pole measures 5.4 mm.

Spleen

The spleen is normal in size, shape, margination and echogenicity. No masses are seen.

Liver

The liver presents normal size and shape with smooth lobar margins. The parenchyma has normal echogenicity with normal echotexture. No focal lesions are seen. Intrahepatic bile ducts are normal. Normal vascular pattern.

The gallbladder presents normal size with anechoic contents. Normal gallbladder wall. No evidence of bile duct distention or obstruction.

Gastrointestinal

The stomach and intestines have normal wall layering and thickness. Colon contains normal contents with normal wall thickness. The stomach is empty.

Pancreas

The visible pancreas is normal in size with normal echogenic parenchyma and surrounded by normal peri-pancreatic mesentery.

Free Abdomen

There are no enlarged abdominal lymph nodes seen on this exam. No free abdominal fluid is seen.

ULTRASONOGRAPHIC FINDINGS

- Moderate urinary bladder debris.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

If urinalysis has not been performed, recommend urinalysis. If active urine sediment, recommend urine culture. No cause for the patient's clinical signs seen on this radiograph. No GI disease is appreciated.

Recommend submitting a Texas A&M GI panel which includes a cPLI, TLI, cobalamin, folate, and resting cortisol to rule out hypoadrenocorticism. Recommend the GI panel to screen the patient for occult pancreatic or occult gastrointestinal disease that may be causing patient's clinical signs. Also recommend full fecal pathogen PCR testing to rule out parasites, protozoal, and pathogenic bacteria as possible cause of patient's clinical signs.
