PRESENTING CLINICAL SIGNS

Chronic vomiting, ultrasound in Oct 2025 found IBD pattern. Currently on Urinary SO + Hypo diet + fibre supplement. Has apparently been doing well since Oct.

Abnormal PE/Chem/CBC/UA Results: BAR, slightly overweight, apparently very healthy pt on PE no recently labwork reported, labs in Oct were all WNL

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The bladder is moderately distended with anechoic urine. No uroliths are seen. The bladder wall is normal in appearance and thickness. No masses are seen.

The left kidney presents normal size with normal shape and architecture. Normal corticomedullary distinction. No pyelectasia, ureteral dilation or nephrolithiasis. The left kidney measured 3.9 cm in length.

The right kidney presents normal size with normal shape and architecture. Normal corticomedullary distinction. No pyelectasia, ureteral dilation or nephrolithiasis. The right kidney measured 4.1 cm in length.

Adrenal Glands

The left adrenal gland presents normal shape and homogenous parenchyma. The phrenic vasculature is unremarkable. The left adrenal gland measures 3.5 mm width.

The right adrenal gland presents normal shape and homogenous parenchyma. The phrenic vasculature is unremarkable. The right adrenal gland measures 3.6 mm width.

Spleen

The spleen is normal in size, shape, margination and echogenicity. No masses are seen.

Liver

The liver presents normal size and shape with smooth lobar margins. The parenchyma has normal echogenicity with normal echotexture. No focal lesions are seen. Intrahepatic bile ducts are normal. Normal vascular pattern.

The gallbladder presents normal size with anechoic contents. Normal gallbladder wall. No evidence of bile duct distention or obstruction. There is a single hypoechoic non-shadowing choleolith present within the gallbladder that measures 2.7 mm x 1.5 mm in size and does not appear obstructive and most likely clinically insignificant.

Gastrointestinal

The gastric wall diffusely has normal layering and thickness, measuring 3.0 mm in width. The stomach contains a moderate amount of gas, otherwise it appears normal. The duodenum is normal in thickness and layering and measures 2.3 mm width. The ileum is normal and has normal layering and thickness measuring 2.1 mm width. The colon contains a small amount of what appears to be firm stool. The colon wall diffusely is normal in thickness measuring 1.9 mm width.

Pancreas

The visible pancreas is normal in size with normal echogenic parenchyma and surrounded by normal peri-pancreatic mesentery.

Free Abdomen

Mild mesenteric lymphadenopathy is present with a representative node measuring 5.2 by 2.9 mm in size. These nodes are most likely reactive, less likely to be enlarged due to neoplasia.

ULTRASONOGRAPHIC FINDINGS

- Mesenteric lymphadenopathy.
- Gallbladder choleolith.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of chronic enteropathy is seen within the small bowel at this time. No significant abnormalities are seen on this scan. Given that the patient is doing well on what is reported to be a hydrolyzed diet. I recommend continuing this diet indefinitely. The patient appears to have diet responsive enteritis.
