

PATIENT PRESENTING CLINICAL SIGNS

Jenny Nunno History: P fell off the bed this afternoon, reluctant to get up and will not put pressure on left front
 Abnormal PE/Chem/CBC/UA Results: toe-touching left front, no pain on palpation.

SPECIES RADIOGRAPHIC STUDY OF THE C-SPINE AND ELBOWS

Canine **C-Spine**

The neck muscles are symmetrically developed.

BREED

Beagle Mix Number and shape of the vertebrae appear physiological. No signs of aggressive osteolysis have been identified.

SEX

Elbows

Spayed Female The trabecular pattern of the long bones close to both elbow joints is coarse and a moderate amount of slightly irregular new bone formation is present on the surfaces. A moderately large spur is located on each medial epicondyle. A small, subchondral lucency is present in the medial right humeral condyle.

AGE

RADIOGRAPHIC DIAGNOSIS

- 11 Years
- Moderate elbow OA, bilateral
 - OCD or kissing lesion right
 - Possible FCP bilateral
 - Ventral thoracic spondylosis (incidental finding)

INTERPRETED BY

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Heike Rudolf, DVM, Dr. med. Vet., DipECVDI DVR The elbow changes are bilateral symmetrically developed and chronic in nature. It is possible that a small bone fragment has become dislodged in the left elbow which may be causing the lameness. Another possibility is myositis of the flexor muscles which often goes along with a medial epicondylar spur. A CT examination of both elbow joints is recommended should the clinical signs not improve with conservative treatment; the plain should be followed by an i.v. contrast study.

HOSPITAL NAME

The Pet Hospital of Stratford Accurate positioning of the spine is difficult even under G.A., and cord compression can only be identified with myelography or in cross sectional imaging. Should the neurological examination reveal deficits, the C-spine should also be assessed with CT to detect intervertebral disc disease.

REFERRING VET

TECHNICAL COMMENTS

Dr. Giuliani Rotation lateral spine.
