

**DATE**

10/7/21

PRESENTING CLINICAL SIGNS

History: Decreased appetite and drinking; seems to have difficulty swallowing. Lethargy & weight loss. Written Rx for doxycycline (100 mg/mL) 0.25 mL PO bid, entyce (30 mg/mL) 0.7 mL PO sid for 7 days, Metacam (1.5 mg/mL) 0.35 mL PO sid for 6 days.

PATIENT

Marley Bonilla

Abnormal PE/Chem/CBC/UA Results:

SPECIES RADIOGRAPHIC STUDY OF THE THORAX

Canine The body condition score is 6/9 with smooth alternating layers of fat and soft tissue opacity.

BREED The bony structures appear physiological.

Yorkshire Terrier

The lungs are in contact with the thoracic boundaries and the tips are pointed. The lobar vessels are clearly visible to the tertiary branches. The bronchial tree is thin walled and tapers uniformly towards the periphery. The degree of pulmonary expansion is fair at best.

SEX

Neutered Male

The cranial mediastinum is of physiological size and opacity. The trachea runs parallel to the thoracic vertebrae and dips at the carina. On the left lateral recumbent view with the head extended the dorsal tracheal air shadow is decreased by a soft tissue band.

AGE

5/11/2015

The cardiac silhouette occupies 75% of the chest height and 3 intercostal spaces (VHS 10.5). No chamber or outflow tract enlargement is evident.

INTERPRETED BY

Heike Rudolf, DVM,
Dr. med. Vet.,
DipECVDI DVR

RADIOGRAPHIC DIAGNOSIS

- Tracheal collapse, mild

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**HOSPITAL NAME**

Claws N Paws AH

The tracheal collapse is mild and unlikely to explain the clinical signs. Abdominal ultrasound and visual inspection of mouth and larynx is recommended. Considering age and breed, dental disease and inflammation of tonsils and other soft tissue structures in the mouth have to be ruled out. Hematology and biochemistry should be performed if it has not already been done.
