

PATIENT PRESENTING CLINICAL SIGNS

Soumi Schultz History: Shakin the bacon a bit much

RADIOGRAPHIC STUDY OF THE PELVIS

SPECIES

Canine

The skin surfaces are smooth and the muscles appear small but symmetrically developed. Skeletal immaturity compatible with the given age is noted.

All bones are well mineralized, have a normal trabecular structure and a smooth surface. Cortical-medullary development and differentiation of the long bones are physiological.

BREED

Gret

The centre of both femoral heads is located well lateral to the respective dorsal acetabular edge. Both hip joints appear incongruent with widening of, especially, the medial joint space. The cranial acetabular edges are straightened and thickened. New bone formation is evident on the right femoral neck.

SEX

Female

RADIOGRAPHIC DIAGNOSIS

- Severe bilateral HD
- Mild OA right femur

AGE

12 Months

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Severe HD is present. Depending on the weight of the dog and the severity of the clinical signs, the various types of surgery can be discussed.
