

**PATIENT PRESENTING CLINICAL SIGNS**

OllieThome History: Recheck thoracic rads for coughing

**RADIOGRAPHIC STUDY OF THE THORAX**

**SPECIES**

The images were compared to the radiographs dated 17.1.23.

Canine

The alveolar pattern in the left caudo-ventral lobe has disappeared and all vessels are well delineated on the lateral views. On the VD a loss of the clear vascular outline is associated with highlighting of peripheral bronchi.

**BREED**

Labradoodle

The other structures appear physiological.

**RADIOGRAPHIC DIAGNOSIS**

**SEX**

- Interstitial pattern L caudal lobe, localized

Neutered Male

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**AGE**

4.6

The localized interstitial lung pattern is a non-specific finding and could be the result of poor re-inflation after previous left lateral recumbency. I feel that currently no further action is required. Should clinical signs related to the respiratory tract recur, further studies will become necessary. E.g. esophageal motility disorder can cause aspiration pneumonia.

**INTERPRETED BY**

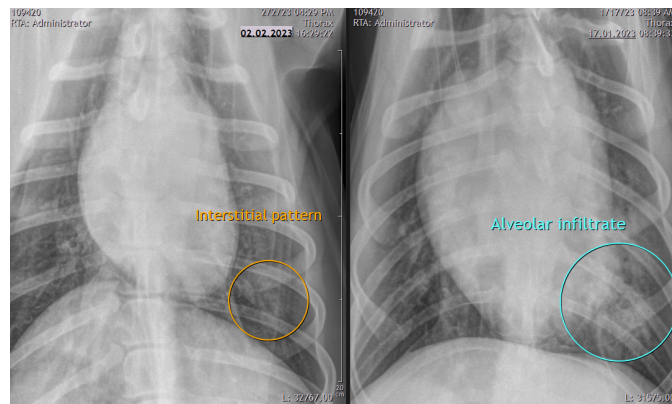

Heike Rudolf, DVM,
