

PATIENT PRESENTING CLINICAL SIGNS

Sky Rodriguez History: P presents for possible ingestion of a scrunchie. O states if happened was probably about 30 hours before presentation. P ate at 9am this morning. No vomiting or diarrhea. BM's are normal. No lethargy.

SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Canine The body condition score is 5/9 with little intra-abdominal fat.

BREED Skeletal immaturity compatible with the given age is noted. The bony structures are within normal limits.

Cane Corso Diaphragm and abdominal wall are intact.

SEX The liver is located within the costal arch and the caudo-ventral lobe is pointed.

Female The spleen appears physiological.

AGE A moderate amount of food is present in the stomach; distribution and size of the small intestinal loops appear physiological; the desc. duodenum and some caudo-ventrally located jejunal loops contain air. Colon and rectum contain a moderate amount of unformed fecal matter.

4 Months Both renal shadows are poorly outlined but do not appear enlarged or altered in their opacity. The bladder shadow is visible just cranial to the pubic brim.

INTERPRETED BY The sublumbar region appears physiological.

Heike Rudorf, DVM,
Dr. med. Vet.,
DipECVDI DVR

RADIOGRAPHIC DIAGNOSIS

- Full stomach and colon

HOSPITAL NAME INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The Pet Hospital of Stratford I can see no radiopaque foreign object or small intestinal dilatation (ileus). Should clinical signs related to the GIT occur, the animal will have to be starved and abdominal ultrasound can be carried out to rule out e.g. lymphadenitis. Pancreatitis and infection somewhere in the body can be eliminated with full hematology and biochemistry.
