

## PATIENT

Rio Gfrerer

## SPECIES

Canine

## BREED

Dachshund Mix

## SEX

Spayed Female

## AGE

4 Years

## WEIGHT

7 kg

## INTERPRETED BY

Heike Rudorf, DVM, Dr.  
med. Vet., DipECVDDI  
DVR

## IMAGING PERFORMED BY

AMC

## HOSPITAL NAME

Green Dog Dental &  
Wellness

## REFERRING VET

Dr. Geist

## INVOICE

36638

## DATE

4/17/26

## PRESENTING CLINICAL SIGNS

- Bite incident occurred this morning at a park
- Attacked by a larger, unfamiliar dog (approximately 10 times heavier)
- Initially improved 10 minutes after incident, then worsened over several hours
- Owner reports right front limb appears hurt
- Owner observes altered gait, not putting full weight on right front limb

## RADIOGRAPHIC STUDY OF THE CARPI

A very mild soft tissue swelling is evident along the lateral aspect of metacarpus (MC) 5, with a small indentation of the skin level with the proximal MC.

The bones are well mineralized, have a normal trabecular structure and smooth, continuous surfaces. Cortico-medullary development and differentiation of the long bones are physiological.

Paws: all sesamoid bones are physiologically developed and have smooth surfaces. The joints are congruent.

## RADIOGRAPHIC DIAGNOSIS

MC 5, right

- Soft tissue swelling
- Suggestion of tooth mark

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I can see no bony involvement. The dermal indentation suggests a bite mark. Should it be penetrating, broad band antibiotic cover is recommended.

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
