

PATIENT PRESENTING CLINICAL SIGNS

Maisy Tackette History: Hx of right hind lameness, no cranial drawer

RADIOGRAPHIC STUDY OF THE PELVIS AND STIFLES

SPECIES

Canine

The skin surfaces are smooth and the muscles appear to be symmetrically developed.

All bones are well mineralized, have a normal trabecular structure and a smooth surface. Cortical-medullary development and differentiation of the long bones are physiological.

BREED

Cocker Spaniel

Pelvis

The centre of both femoral heads is located medial to the respective dorsal acetabular edge. Both hip joints appear congruent with even subchondral bone surfaces. No new bone formation is evident.

SEX

Female

Stifles

Both stifle joints have smooth subchondral bone surfaces and the centre of the femoral condyles is in line with the intercondylar eminence. The cranial fat pad has a physiological size and the caudal fascial plains are in a physiological position. New bone formation is not evident and the patellae are located in their respective groove.

RADIOGRAPHIC DIAGNOSIS

INTERPRETED BY

- I can see no abnormalities

Heike Rudolf, DVM,
Dr. med. Vet.,
DipECVDI DVR

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I can see no changes that would explain the right sided lameness. Soft tissue injuries such as enthesopathy of the gastrocnemius muscle and flexor tendinitis can only be detected in cross sectional imaging and contrast CT or MRI is thus recommended.

HOSPITAL NAME

Torch Lake VC

TECHNICAL COMMENTS

Non-DICOM images were submitted. The transformation from DICOM to other formats reduces the image quality and only allows limited manipulation of the image. More subtle lesions can thus easily be missed. For the best possible imaging reports, I suggest submitting DICOM images in the future.
