PRESENTING CLINICAL SIGNS

History: Heartworm positive. Has been positive for 15 months and is currently on slow kill process. Not clinical

Abnormal PE/Chem/CBC/UA Results: HW Ag positive, microfilariae negative.

RADIOGRAPHIC STUDY OF THE THORAX

The body condition score is 7/9 with smooth alternating layers of fat and soft tissue opacity. The bony structures appear physiological.

The lungs are in contact with the thoracic boundaries and the tips are pointed. The lobar vessels are clearly visible to the tertiary branches and have a physiological size. The bronchial tree is thin walled and tapers uniformly towards the periphery.

The cranial mediastinum is of physiological size and opacity. The trachea diverges from the thoracic vertebrae and the carina is located at T5.

The cardiac silhouette occupies 75% of the chest height and 2.5 intercostal spaces (VHS 10). No chamber or outflow tract enlargement is evident.

RADIOGRAPHIC DIAGNOSIS

- Physiological study

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I can see no abnormalities. However, echocardiography is recommended to allow comparison of B- and M-mode parameters with future studies.
