Heike Rudolf, DVM, Dr.
med. Vet., DipECVDI
DVR

IMAGING PERFORMED BY

Allison

HOSPITAL NAME

Elizabeth AH

REFERRING VET

Kim Allyn, DVM

INVOICE

37381

DATE

6/5/26

PRESENTING CLINICAL SIGNS

History: Checking progress of tail deformity.

RADIOGRAPHIC STUDY OF THE TAIL

The surrounding soft tissue structures are slightly dorsally deviated in the center of the radiograph. This is accompanied by a vertebra that appears wedge shaped on the lateral and shorter on the VD view.

The vertebral surfaces are smooth. No evidence of osseous destruction or lysis is present.

RADIOGRAPHIC DIAGNOSIS

- Congenital vertebral anomaly

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely cause for the tail deformity is congenital. I assume that previous radiographs were taken which may have shown a different cause, e.g. trauma, because checking the “progress” is requested.

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance, please contact me.
