

PATIENT PRESENTING CLINICAL SIGNS

Breezy Lee Breezy presents today for BBD laceration on left front leg and muzzle. P got into a scuffle with housemate last night. P has bite wound on LFL and abrasion on muzzle. O's gave some gabapentin they had on hand.

SPECIES Abnormal PE/Chem/CBC/UA Results: Integument :Bite wounds to LTL-multiple puncture wounds and one open wound on caudal aspect distal to elbow that is about 1 cm across Musculoskeletal :Weight bearing lame LTL with significant swelling of proximal antebrachium.

Canine

BREED RADIOGRAPHIC STUDY OF THE CARPI

Pitbull An antebrachial soft tissue swelling is present and lucent tracts penetrate the skin surface on the caudo-medial aspect. Multiple small, punctate lucencies are present subcutaneously on the media aspect of the distal radius.

SEX A small amount of new bone formation is present on the anconeal process and the cranial radial head. A small, smooth bony protuberance extends medially from the medial epicondyle.

Sprayed Female

The bony fragment cranial to the supraglenoid tuberosity most likely represents a rudimentary clavicle.

AGE RADIOGRAPHIC DIAGNOSIS

7 Years
Antebrachium, left

INTERPRETED BY

- Soft tissue swelling
- Skin wounds extending into the soft tissue
- S.c. emphysema distal radius

Heike Rudorf, DVM,
Dr. med. Vet.,
DipECVDI DVR
Elbow, left

HOSPITAL NAME

- Mild OA
- Epicondylar spur

DTLAvets INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

REFERRING VET The changes appear to be focused on the antebrachium and comprise swelling, puncture wounds and s.c. emphysema. I can see no bony changes associated with the puncture wounds. The elbow changes are chronic and unlikely to be causing clinical signs. However, should a lameness still be present after successful treatment of the bite wounds, a CT examination is recommended to rule out myositis and FCP.
