

**PATIENT**

Topsy Shetty

PRESENTING CLINICAL SIGNS

front right leg limp is on and off

RADIOGRAPH OF SHOULDERS AND ELBOWS**SPECIES**

Canine

Shoulder: 3x cran-caud., 1x L and 1x R lateral

Elbow: 2x L lateral flexed, L lateral extended, 2x R lateral flexed, R lateral extended,

Additional views: 1x lateral C2-T7 including upper fore legs

BREED

Great Pyrenees Mix

RADIOGRAPHIC FINDINGS

The bones are well mineralized, have a normal trabecular structure and smooth, continuous surfaces. Cortical-medullary development and -differentiation of the long bones are physiological.

SEX

Neutered Male

Right shoulder:

The joint appears congruent with even subchondral bone surfaces. A small, smooth osteophyte is present on the caudal humeral head.

AGE

8 Years

Left shoulder:

The joint appears congruent with even subchondral bone surfaces.

INTERPRETED BY

Heike Rudolf, DVM,
Dr. med. Vet.,
DipECVDI DVR

The elbow joints are congruent with smooth subchondral bone surfaces. Joint swelling is not apparent.

RADIOGRAPHIC DIAGNOSIS

- Small osteophyte R humerus

HOSPITAL NAME

Truscott Animal
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I can see no changes that would explain the clinical signs. Myositis and desmopathy of the flexor tendons of the elbow as well as tendinitis related to the tendons of the paw should be considered. Contrast CT or MRI is necessary to detect these changes. Bicipital tenosynovitis or tendinitis of the bicipital tendon as well as muscle abscesses or tumors can be detected with ultrasound and/or cross sectional imaging.
