

**PRESENTING CLINICAL SIGNS****PATIENT**

Bella Yoon
History: CC ACUTE LAMENESS LF EXAM--PAIN UPON PLAPTION OF LONG BONE /HUMERUS-SHOULDER R/O SOFT TISSUE VS DEVELOPMENTAL DZ VS PANOSTEITIS VS OTHER
Abnormal PE/Chem/CBC/UA Results:

SPECIES RADIOGRAPHIC STUDY OF THE SHOULDERS

Canine Age related skeletal immaturity is noted.

BREED Islands of sclerosis are present in the left distal humeral diaphysis. On the cranio-caudal view a similar change appears to be present on the right side.

Doberman Pinscher The shoulder joints appear congruent with even subchondral bone surfaces. No new bone formation is evident.

SEX RADIOGRAPHIC DIAGNOSIS

Female

- Panosteitis humeri (left more than right)

AGE INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

5 Months The change is compatible with the clinical findings of pain on deep palpation of a long bone. The disease is self-limiting but can affect along bones at various times until skeletal maturity has been reached. NSAIDs will ease the pain.

TECHNICAL COMMENTS

INTERPRETED BY Only jpg images were submitted. The transformation from DICOM to jpg reduces the image quality and only allows limited manipulation of the image. More subtle lesions can thus easily be missed. For the best possible imaging reports I suggest submitting DICOM images in the future.
