

PATIENT

Rolo Mackey

PRESENTING CLINICAL SIGNS

History: Intermittent limping on left hind
Abnormal PE/Chem/CBC/UA Results:

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE LEFT STIFLE

The skin surfaces are smooth and the muscles appear well developed.

Age related skeletal immaturity is noted.

BREED

Catahoula Leopard

The skeletal structures are well mineralized, with physiological cortico-medullary development and differentiation.

SEX

Neutered Male

The left stifle joint has smooth subchondral bone surfaces. The cranial fat pad has a physiological size and the caudal fascial plains are in a physiological position. New bone formation is not evident and the patella appears to be in a physiological position, considering the leg extension. The tibial crest is in a physiological position.

AGE

9 Months

One of the tibio-tarsal joint spaces appears wide.

RADIOGRAPHIC DIAGNOSIS

- Possible hock OCD

INTERPRETED BY

Heike Rudolf, DVM,
Dr. med. Vet.,
DipECVDI DVR

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I can see no obvious changes in the stifle joint. For accurate assessment of the hocks, two orthogonal views should be obtained.
