

PATIENT PRESENTING CLINICAL SIGNS

Shelby Copernico History: inappetence
Abnormal PE/Chem/CBC/UA Results: Pending

SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Canine The body condition score is 6/9 with smooth alternating layers of fat and soft tissue opacity.
The bony structures are within normal limits.

BREED The abdominal detail is good; diaphragm and abdominal wall are intact.

Doberman The liver is located within the costal arch and the caudo-ventral lobe is pointed.

SEX The spleen appears physiological.

Spayed Female The stomach contains a small amount of air, and its caudal border is slightly cranially displaced; between stomach and the small intestinal loops appears to be an elongated soft tissue opacity. The colon contains a small amount of fecal matter.

AGE Both renal shadows appear to have a physiological size and opacity.

9 Years The visible sublumbar region appears physiological.

INTERPRETED BY RADIOGRAPHIC DIAGNOSIS

Heike Rudolf, DVM,
Dr. med. Vet.,
DipECVDI DVR

- Possible pancreatic disease

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

HOSPITAL NAME

New Bridge VP

The soft tissue opacity caudal to the stomach may represent an enlarged pancreas. The results of biochemistry and hematology may point in a particular direction and can be further explored with abdominal ultrasound (e.g. in case of pancreatic disease) or echocardiography (in case of early DCM).
