

PATIENT PRESENTING CLINICAL SIGNS

Soleil Seekings

Chronic barbering of ventral abdomen - has been ongoing, however recently more hair loss on the belly. Appetite is good No vomiting or diarrhea Indoor cat On Prednisolone 5mg daily
Abnormal PE/Chem/CBC/UA Results: Mild ALT elevation

SPECIES

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

BREED

DSH

Urinary System

The urinary bladder is moderately distended with anechoic urine. The Bladder wall, trigone, ureteral papillae and visible urethra (to a depth of 2cm) appear normal with no evidence of wall thickening, mucosal irregularities, masses or cystic calculi.

SEX

Spayed Female

The left kidney has a normal shape and size (3.5 cm). Overall echogenicity is normal with adequate corticomedullary distinction and a typical 1:3 cortex:medulla ratio. There is no evidence of focal perinephric inflammation or effusion. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter. Renal vasculature is normal.

AGE

12 Years

The right kidney has a normal shape and size (3.01 cm). Overall echogenicity is normal with adequate corticomedullary distinction and a typical 1:3 cortex:medulla ratio. There is no evidence of focal perinephric inflammation or effusion. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter. Renal vasculature is normal.

WEIGHT

4.83 kg

Adrenal Glands

The region of left adrenal (Cranial to left renal artery) is unremarkable but the adrenal is not distinctly visualized. No evidence of a mass effect.

INTERPRETED BY

Eric Lindquist, DMV

The right adrenal gland is normal in size measuring XX cm at the caudal pole. It is observed in its normal position between the cranial aspect of the right kidney and the caudal vena cava. It is normal in appearance (uniformly hypoechoic) and shape with no evidence of a mass effect.

DABVP, Cert. IVUSS

Spleen

IMAGING PERFORMED BY

Dr. Singh

The spleen is subjectively normal in size (0.83 cm in width at the level of the hilus), echotexture is homogenous, and the splenic capsule is smooth with no irregularities. The blood flow through the hilus and splenic parenchyma appears normal. There is a hyperechoic lesion visualized within the splenic parenchyma measuring 0.23 cm in diameter.

HOSPITAL NAME

Balmy Beach PH

Liver

The liver is subjectively normal in size, and echogenicity with smooth peripheral margins. The parenchyma is homogenous echotexture. The visible portions of the vasculature and biliary tract appear normal. No focal nodules or cystic lesions are observed.

REFERRING VET

Dr. Singh

The gallbladder lumen is moderately distended. The wall of the gall bladder is not thickened and has a smooth mucosal surface. Luminal contents are mild and primarily anechoic. The cystic and common bile ducts are normal/not visible.

INVOICE

42980

Gastrointestinal

The stomach is moderately dilated with fluid and irregular shadowing material most consistent with normal ingesta and gas. It measures at a normal thickness of <0.36cm with some variability due to the presence of rugal folds. The distinction of the gastric wall layering is adequate and there is no impression of reduced peristaltic activity. No masses or focal lesions were observed.

DATE

11/24/22

PATIENT

Soleil Seekings

The visualized areas of duodenum, jejunum and ileum have a relatively uniform diameter with minimal fluid distension. Wall thickness is normal. Bowel loops follow a curvilinear path with distinct wall layering maintaining the typical 1:3 muscularis:mucosa layer ratio. The duodenum measured as normal (between 0.13-0.38cm in wall thickness) and the jejunum measured as normal (between 0.15-0.36cm.) Visualized peristalsis appears appropriate. There were no focal lesions consistent with obstruction or a mass effect observed.

SPECIES

Feline

The ileocecal junction was visualized and exhibited normal intact wall layering and is subjectively of normal thickness. Sections of colon are visualized with formed fecal material and gas shadowing distally. There is no observed focal or generalized colon wall thickening or loss of layering.

BREED

DSH

Pancreas

The pancreas is normal and isoechoic to surrounding mesentery. There is no evidence of nodules or cystic lesions. There is no evidence of regional mesenteric inflammation or fluid.

SEX

Spayed Female

Free Abdomen

Evaluation of the peritoneal cavity did not reveal any evidence of effusion, or subjective lymphadenomegaly. The Medial iliac nodes appear normal and there was no evidence of a caudal aortic thrombus at the bifurcation. The omentum is of normal uniform echogenicity.

AGE

12 Years

ULTRASONOGRAPHIC FINDINGS

WEIGHT

4.83 kg

- Small hyperechoic lesion visualized in the spleen – This has the characteristics consistent with a benign myelolipoma. Recommend continued monitoring.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INTERPRETED BY

Eric Lindquist, DMV

Today's scan is relatively normal. There is no obvious source of discomfort causing excessive grooming, and no focal lesions associated with the liver are visualized. Consider a liver function test to further evaluate the ALT elevation. If this is progressive, persistent, or the bile acids are abnormal, consider a fine needle aspirate of the liver +/- a biopsy. Additionally, consider a quantitative fPLI measurement to look for evidence of subtle pancreatitis, which was not evident on today's scan.

DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Dr. Singh

Recommend three view thoracic radiographs to evaluate for possible concurrent thoracic disease/involvement.
