

PATIENT

Panther Vargas

PRESENTING CLINICAL SIGNS

Decreased appetite, mass effect noted on rads.
Abnormal PE/Chem/CBC/UA Results: Pending

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

DSH

The urinary bladder is moderately distended with anechoic urine. The Bladder wall, trigone, ureteral papillae and visible urethra (to a depth of 2cm) appear normal with no evidence of wall thickening, mucosal irregularities, masses or cystic calculi.

SEX

Spayed Female

The left kidney has a normal shape and size (3.45 cm). Overall echogenicity is normal with adequate corticomedullary distinction and a typical 1:3 cortex:medulla ratio. There is no evidence of focal perinephric inflammation or effusion. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter. Renal vasculature is normal.

AGE

11 Years

The right kidney has a normal shape and size (3.29 cm). Overall echogenicity is normal with adequate corticomedullary distinction and a typical 1:3 cortex:medulla ratio. There is no evidence of focal perinephric inflammation or effusion. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter. Renal vasculature is normal.

WEIGHT

8.7 Pounds

Adrenal Glands

The left adrenal gland is normal in size measuring 0.37 cm at the caudal pole. It is observed in its normal position cranial to the left renal artery. It is normal in appearance (uniformly hypoechoic) and shape with no evidence of a mass effect.

INTERPRETED BY

Kathleen Sennello DVM,
MS, Diplomate ACVIM
(Small Animal Internal
Medicine)

The right adrenal gland is normal in size measuring 0.40 cm at the caudal pole. It is observed in its normal position between the cranial aspect of the right kidney and the caudal vena cava. It is normal in appearance (uniformly hypoechoic) and shape with no evidence of a mass effect.

Spleen

The spleen is subjectively normal in size (0.95 cm in width at the level of the hilus), echotexture is homogenous, and the splenic capsule is smooth with no irregularities. The blood flow through the hilus and splenic parenchyma appears normal. No focal parenchymal abnormalities are visualized.

IMAGING PERFORMED BY

Shari Reffi, CVT

Liver

HOSPITAL NAME

Companion AH

The liver is large and irregular. The parenchyma is homogenous echotexture. The visible portions of the vasculature and biliary tract appear normal. There is a solid hypoechoic, slightly mixed echogenic mass effect visualized towards the left side of the liver, measuring at least 6.0 cm x 5.44 cm.

REFERRING VET

Dr. Tsai

The gallbladder lumen is moderately distended. The wall of the gall bladder is not thickened and has a smooth mucosal surface. Luminal contents are mild and primarily anechoic. The cystic and common bile ducts are normal/not visible.

Gastrointestinal

INVOICE

43021

The stomach contains minimal luminal contents. It measures at a normal thickness of <0.36cm with some variability due to the presence of rugal folds. The distinction of the gastric wall layers is adequate and there is no impression of reduced peristaltic activity. No masses or focal lesions were observed.

DATE

11/29/22

PATIENT

Panther Vargas

The visualized areas of duodenum, jejunum and ileum have a relatively uniform diameter with minimal fluid distension. Wall thickness is normal. Bowel loops follow a curvilinear path with distinct wall layering maintaining the typical 1:3 muscularis:mucosa layer ratio. The duodenum measured as normal (between 0.13-0.38cm in wall thickness) and the jejunum measured as normal (between 0.15-0.36cm.) Visualized peristalsis appears appropriate. There were no focal lesions consistent with obstruction or a mass effect observed.

SPECIES

Feline

The ileocecal junction was visualized and exhibited normal intact wall layering and is subjectively of normal thickness. Sections of colon are visualized with formed fecal material and gas shadowing distally. There is no observed focal or generalized colon wall thickening or loss of layering.

BREED

DSH

Pancreas

The pancreas is prominent and hypoechoic as compared to the surrounding isoechoic mesentery. There is no evidence of nodules or cystic lesions. There is no evidence of regional mesenteric inflammation or fluid.

SEX

Spayed Female

Free Abdomen

There is a small amount of free abdominal fluid. No lymphadenopathy. The omentum is generally of normal echogenicity.

AGE

11 Years

ULTRASONOGRAPHIC FINDINGS

WEIGHT

8.7 Pounds

- Hypoechoic, prominent pancreas – The pancreatic changes are most consistent with age-related parenchymal remodeling, potentially secondary to a prior inflammatory episode, early fibrosis or chronic pancreatitis.
- Large, solid, hypoechoic/mixed echogenic hepatic mass – Findings are most consistent with a primary hepatic mass. Consider such differentials as adenoma, carcinoma, lymphoma, etc.
- Small volume free abdominal fluid

INTERPRETED BY

Kathleen Sennello DVM,
MS, Diplomate ACVIM
(Small Animal Internal
Medicine)

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is a large mass effect that appears to be arising from the liver. No other lesions are visualized in the abdomen. I suspect surgical removal would be possible with a liver lobectomy. Recommend referral to a veterinary surgeon +/- contrast CT scan for surgical planning. Recommend 3-view thoracic radiographs. You could consider a fine needle aspirate of the liver mass prior to removal to rule out lymphoma.

IMAGING PERFORMED BY

Shari Reffi, CVT

HOSPITAL NAME

Companion AH

The pancreas appears somewhat hypoechoic and prominent with minimal surrounding inflammation. This could be consistent with mild current inflammation or previous episodes of inflammation.
