

PATIENT

Mia Vigorito

PRESENTING CLINICAL SIGNS

Recheck AUS, IBD like symptoms. O and off nausea/ vomiting.

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

Poodle

The urinary bladder is moderately distended with anechoic urine. The Bladder wall, trigone, ureteral papillae and visible urethra (to a depth of 2cm) appear normal with no evidence of wall thickening, mucosal irregularities, masses or cystic calculi.

SEX

Spayed Female

The left kidney has a normal shape and size (5.83 cm). Overall echogenicity is normal with adequate corticomedullary distinction and a typical 1:3 cortex:medulla ratio. There is no evidence of focal perinephric inflammation or effusion. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter. Renal vasculature is normal.

AGE

8 Years 5 Months

The right kidney has a normal shape and size (4.86 cm). Overall echogenicity is normal with adequate corticomedullary distinction and a typical 1:3 cortex:medulla ratio. There is no evidence of focal perinephric inflammation or effusion. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter. Renal vasculature is normal.

WEIGHT

41.2 lbs

Adrenal Glands

INTERPRETED BY

Kathleen Sennello DVM,
MS, Diplomate ACVIM
(Small Animal Internal
Medicine)

The left adrenal gland is normal in size measuring 0.49 cm at the cranial pole and 0.64 cm at the caudal pole. It is observed in its normal position cranial to the left renal artery. It is normal in appearance (uniformly hypoechoic) and shape with no evidence of a mass effect.

IMAGING PERFORMED BY

Kerri Becker

The right adrenal gland is normal in size measuring 0.99 cm at the cranial pole and 0.43 cm at the caudal pole. It is observed in its normal position between the cranial aspect of the right kidney and the caudal vena cava. It is normal in appearance (uniformly hypoechoic) and shape with no evidence of a mass effect.

HOSPITAL NAME

Legacy Animal Hospital

Spleen

The spleen is subjectively normal in size (3.36 cm), echotexture is homogenous, and the splenic capsule is smooth with no irregularities. The blood flow through the hilus and splenic parenchyma appears normal. No focal parenchymal abnormalities are visualized.

REFERRING VET

Dr. Potenzone

Liver

The liver is subjectively large in size, and normal in echogenicity with smooth peripheral margins. The parenchyma is mildly heterogenous in echotexture with subtle, indistinct focal mottling. The visible portions of the vasculature and biliary tract appear normal. No focal nodules or cystic lesions are observed.

INVOICE

74515

The gall bladder lumen is moderately distended. The wall of the gall bladder is not thickened and has a smooth mucosal surface. Luminal contents are mild and likely incidental at this time. The cystic and common bile ducts are normal/not visible.

DATE

4/16/26

PATIENT

Gastrointestinal

Mia Vigorito

The stomach contains minimal luminal contents. It measures at a normal thickness of 0.59 cm with some variability due to the presence of rugal folds. The distinction of the gastric wall layers is adequate and there is no impression of reduced peristaltic activity. No masses or focal lesions were observed.

SPECIES

Canine

The visualized areas of duodenum, jejunum and ileum have a relatively uniform diameter with minimal fluid distension. Wall thickness is normal. Bowel loops follow a curvilinear path with distinct wall layering maintaining the typical 1:3 muscularis:mucosa layer ratio. Jejunum wall measures 0.36 cm. Visualized peristalsis appears appropriate. There were no focal lesions consistent with obstruction or a mass effect observed.

BREED

Poodle

SEX

The ileocecal junction is somewhat obscured by gas on today's exam. The visualized areas of colon wall appear to have intact wall layering +/- mild thickening measuring at 0.30 cm.

Spayed Female

Pancreas

AGE

The area of the pancreas is normal and isoechoic to surrounding mesentery. There is no evidence of nodules or cystic lesions. There is no evidence of regional mesenteric inflammation or fluid.

8 Years 5 Months

Free Abdomen

WEIGHT

Evaluation of the peritoneal cavity did not reveal any evidence of effusion, or subjective lymphadenomegaly. The Medial iliac nodes appear normal and there was no evidence of a caudal aortic thrombus at the bifurcation. The omentum is of normal uniform echogenicity.

41.2 lbs

INTERPRETED BY

ULTRASONOGRAPHIC FINDINGS

Kathleen Sennello DVM,
MS, Diplomate ACVIM
(Small Animal Internal
Medicine)

- Mildly heterogeneous liver – The diffuse hepatic changes are non-specific and could be consistent with vacuolar hepatopathy, nodular hyperplasia, inflammatory/immune-mediated disease, fibrosis, extramedullary hematopoiesis, toxic hepatopathy (e.g., copper), infiltrative neoplasia (less likely) or other hepatopathy.
- Mildly thickened colon wall with intact wall layering – Findings could be consistent with mild inflammation/colitis.

IMAGING PERFORMED BY

Kerri Becker

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

HOSPITAL NAME

The right adrenal gland appears more normal in size on today's exam. Continued monitoring is warranted.

Legacy Animal Hospital

REFERRING VET

Visualization of the ileocecal junction is somewhat obscured by gas on today's exam. No severe colon wall thickening or mass effect observed.

Dr. Potenzzone

INVOICE

The liver appears mildly heterogeneous. The significance of this is uncertain. If liver enzymes are normal, this may be incidental/an anatomic variation. Correlate with current bloodwork.

74515

If GI symptoms are persistent, the recommendations from the previous exam would still be relevant, ultimately potentially resulting in biopsies of the GI tract if empirical therapy is not effective.
