

PATIENT

Mowgli Hustad

SPECIES

Canine

BREED

Nova Scotia Duck
Toller

SEX

MN

AGE

7 years

WEIGHT

21.8 kg

PRESENTING CLINICAL SIGNS

Hematochezia. Enemas performed to re-assess lesion in descending colon.

ULTRASONOGRAPHIC EXAMINATION OF THE COLON

There is an irregular mixed echogenicity, hypoechoic luminal mass effect visualized in the distal colon measuring 1.88 cm x 3.61 cm. This is a moderately vascular lesion with a suspected narrow attachment. There are prominent hypoechoic enlarged regional lymph nodes. A left colic lymph node is visualized measuring 0.71 cm x 1.93 cm.

ULTRASONOGRAPHIC FINDINGS

- Colonic mass lesion. Possible differentials include adenoma, carcinoma, sarcoma, other.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The suspected descending colonic mass lesion is confirmed with a suspected narrow attachment; this could represent a benign or neoplastic lesion. Ideally, colonoscopy would be performed both to evaluate the mass lesion, obtain biopsies, and to fully evaluate the length of the colon looking for any additional lesions which could be concerning for a possible metastatic process. The location in the colon of the lesion can be confirmed for potential surgical planning.
