Cardiac Presentation

The left atrium was moderately enlarged. The mitral valve shows myxomatous changes compatible with myxomatous mitral valve disease and secondary severe mitral valve regurgitation. The left ventricle was normal. The myocardium was normal. Contractility of the left ventricle shows hyperdynamic function. Left ventricular outflow tract was mildly dilated. The right atrium was normal. No evidence of masses. The tricuspid valve shows degenerative changes with severe tricuspid valve regurgitation. The right ventricle was normal. The pulmonic tract was normal. No visible pericardial effusion or pleural effusion. The cranial mediastinum and pericardial regions were free of masses in the visible windows.
