PRESENTING CLINICAL SIGNS

Patient diagnosed with SCC. Patient imaging today to consider surgical treatment. Thoracic radiographs were obtained with no evidence of metastatic disease.

COMPUTED TOMOGRAPHIC STUDY OF THE HEAD

Plain images provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

A poorly delimited aggressive bone lesion is noted on the medio-rostral portion of the right mandibular body with lysis and proliferative reaction measuring at least 4,5 cm long.

The brain is unremarkable with no evidence of mass effect or hemorrhage.

The nasal cavities present without fluid or mass. No turbinate lysis is seen. The frontal sinuses present with air content on both sides.

The mandibular and retropharyngeal lymph nodes appear symmetric with normal size and shape.

The salivary glands appear normal.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Aggressive mass on the right mandibular body.

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS

Primary infiltrative neoplasm like squamous cell carcinoma (already diagnosticated) is likely. Osteomyelitis is less likely. The use of venous contrast is indicated for better evaluation of soft tissue component limits. Pulmonary staging may be considered according to the histological findings and oncological evaluation.
