PRESENTING CLINICAL SIGNS

- Ingested nitrile glove with grease 5 days ago
- Vomiting began 4 days ago; ~6 episodes intermittently
- Diet switched to ground beef and rice; tolerated until today
- Vomited 5-6 times today, including while walking; not associated with eating
- Last meal: yesterday afternoon; no breakfast offered today
- No evidence of glove in feces; bowel movements normal
- No tenesmus or straining during defecation
- Current medications: Trazodone administered today for anxiety

Abnormal PE/Chem/CBC/UA Results: Pending rads and blood chem

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder, trigone, cystourethral junction, and visible pelvic urethra exhibited normal thickness and tone. Anechoic urine was present in the lumen with no evidence of urine/lumen sediment, mineral, or calculi. The ureteral papillae were normal. The ureters were not visible which is normal. No evidence of inflammatory or neoplastic changes was noted.

Normal size and margination were present in the kidneys. A normal 1:3 cortex / medulla ratio and normal corticomedullary definition were maintained. The echogenicity of the cortex was similar to or slightly less than normal liver parenchyma while the medulla echogenicity was hypoechoic to the cortex with no evidence of pelvic dilation. The left kidney measured 3.5 cm in length. The right kidney measured 3.6 cm in length.

The area of the aortic trifurcation was free of pathology.

Adrenal Glands

The left adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The left adrenal gland measured 0.5 cm width at the caudal pole. The right adrenal gland was not definitively visualized, no overt pathology in the area of the right adrenal gland.

Spleen

The spleen exhibited a finely textured and homogenous parenchyma which was hyperechoic to the liver and renal cortical parenchyma. The capsule was smooth and regular without apparent expansion. The splenic vasculature at the hilus was normal in volume with no evidence of congestion or thrombosis. Acute to chronic inflammatory, neoplastic, or benign parenchyma changes were not noted.

Liver/Gallbladder

The liver was subjectively normal in size, structure, and contour. The liver parenchyma was uniform and hypoechoic to the spleen with a mild coarse echotexture. Normal vascular volume. The hepatic and portal vasculature were normal in appearance without signs of congestion. The gallbladder was non-distended in size with thin walls and primarily anechoic luminal content. The cystic and common bile ducts were normal.

The stomach presented intact wall layering with a normal wall layer ratio. The lumen of the stomach contained mild non-shadowing ingesta sonographically suggestive of food echogenicity with no signs of obstruction or foreign material.

The small intestine presented intact wall layering with 1:3 muscularis/mucosa ratio. The lumen of the small intestine was empty with mild segmental non-shadowing chyme and gas to the level of the colon. No signs of obstruction or foreign material.

Normal visible colon wall layers were present. The colon was mildly distended with generalized soft to non-formed fecal matter.

Pancreas

The parenchyma of the left limb, body and right limb of the pancreas presented isoechoic to the adjacent omental fat. A normal curvilinear capsule contour of the pancreas was present. The visible pancreatic duct was normal. No signs of active inflammation or neoplastic disease was evident.

Free Abdomen

No omental masses, overt lymphadenopathy or peritoneal effusion was present.

ULTRASONOGRAPHIC FINDINGS

Primary

- Overall, sonographically normal gastrointestinal tract with mild non-shadowing gastric and segmental intestinal ingesta/ chyme- no evidence of obstructive pattern or shadowing content
- Generalized mild colon distention with soft / non-formed fecal matter
- Normal area of pancreas

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of current gastroenterocolic foreign body. Structurally unremarkable gastroenteritis, potentially secondary to dietary indiscretion, is favored. No indication for immediate surgical intervention with gastrointestinal support and clinical monitoring recommended. Sonographic reassessment indicated if persistent or progressive gastrointestinal signs.
