PRESENTING CLINICAL SIGNS

- Hx of Lyme dz lethargy dilated stomach on imaging , painful on abd palpation

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder, trigone, cystourethral junction, and visible pelvic urethra to a depth of 3.0 cm exhibited normal thickness and tone. Anechoic urine was present in the lumen with no evidence of urine or lumen sediment, mineral, or calculi. The ureteral papillae were normal. The ureters were not visible which is normal. No evidence of inflammatory or neoplastic changes was noted.

No evidence of pathology in the area of the aortic trifurcation.

Normal size and margination were present in the kidneys. A normal 1:3 cortex / medulla ratio and normal corticomedullary definition were maintained. The echogenicity of the cortex was similar to or slightly less than normal liver parenchyma while the medulla echogenicity was hypoechoic to the cortex with no evidence of pelvic dilation. The left kidney measured 6.0 cm in length. The right kidney measured 5.7 cm in length.

Adrenal Glands

The left and right adrenal glands were overtly normal in size, position, and shape, though the right adrenal gland was indistinctly visualized. The left adrenal gland measured 0.54 cm caudal pole width and the right adrenal gland subjectively measured 0.43 cm caudal pole width.

Spleen

The spleen exhibited a finely textured and homogenous parenchyma which was hyperechoic to the liver and renal cortical parenchyma. The capsule was smooth and regular without apparent expansion. The splenic vasculature at the hilus was normal in volume with no evidence of congestion or thrombosis. Acute to chronic inflammatory, neoplastic, or benign parenchyma changes were not noted.

Liver/ Gallbladder

The liver was subjectively normal in size, structure, and contour. The liver parenchyma was uniform and hypoechoic to the spleen with a mild coarse echotexture. The hepatic and portal vasculature were normal in appearance without signs of congestion. The gallbladder was non-distended in size with thin walls and primarily anechoic luminal content. The cystic and common bile ducts were normal.

Gastrointestinal

The stomach presented intact wall layering with a normal wall layer ratio. The lumen of the stomach was empty without evidence of retained ingesta, fluid, or foreign material.

The small intestine presented intact wall layering with 1:3 muscularis/mucosa ratio. The lumen of the small intestine was empty with no signs of ileus, obstruction, or foreign material.

PATIENT

Normal visible colon wall layers were present with apparent formed feces in lumen.

Willow Acevedo

Pancreas

SPECIES

The parenchyma of the left limb, body, and right limb of the pancreas presented isoechoic to the adjacent omental fat. A normal curvilinear capsule contour of the pancreas was present. The visible pancreatic duct was normal. No signs of active inflammation or neoplastic disease were evident.

Canine

BREED

Free Abdomen

Airedale

No overt lymphadenopathy or peritoneal effusion was present.

SEX

ULTRASONOGRAPHIC FINDINGS

FS

- Sonographically normal empty gastrointestinal tract
- Normal area of pancreas
- Sonographically normal bilateral kidneys

AGE

7

WEIGHT

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

57

No current evidence of gastrointestinal mechanical / metabolic ileus. A definitive cause of reported abdominal discomfort or pain was not obvious. Supportive care is recommended. Recheck urinalysis is recommended if not recently done. Spec cPL or a GI panel to include PLI/TLI/Cobalamin/Folate could be considered for evidence of mild pancreatitis, which may present as sonographically normal or if gastrointestinal signs are present.
