

PATIENT

Wilson Caponegro

PRESENTING CLINICAL SIGNS

Suspicion of thyroid/parathyroid lesions. High calcium.

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE NECK

The left thyroid was sonographically normal in size, contour and echogenicity, measuring 2.0 cm length x 0.37 cm in width. The right thyroid gland exhibited overall normal size, contour and parenchyma echogenicity, measuring 2.0 cm length x 0.41 cm in width. Within the right thyroid, a well circumscribed, oval, hypoechoic nodule measuring approximately 0.5-0.6 cm in diameter was present. The hypoechoic nodule subjectively was located within the internal aspect of the right thyroid gland. The parathyroid structures including the trachea were sonographically unremarkable.

BREED

Poodle X

SEX

Neutered Male

ULTRASONOGRAPHIC FINDINGS

- Right parathyroid nodule - suspect adenoma

AGE

7 Years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Correlation with PTH levels recommended. Right parathyroidectomy is likely indicated given the presence of the parathyroid nodule in the face of hypercalcemia pending correlation with PTH levels and assuming no evidence of renal disease or nutritional deficiencies.
