PRESENTING CLINICAL SIGNS

New patient to clinic. Has long history of allergies and ear infections. Has zymox ear meds at home. Is currently taking apoquel daily. Had some weight loss last December and an ultrasound that showed an enlarged spleen per client.

Abnormal PE/Chem/CBC/UA Results: During abdominal palpation, suspected splenic tumor.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**Urinary System**

The urinary bladder, trigone, cystourethral junction, and visible pelvic urethra to a depth of 3.0 cm exhibited normal thickness and tone. Anechoic urine was present in the lumen with no uroliths or sediment. The ureteral papillae were normal. The ureters were not visible which is normal. No evidence of inflammatory or neoplastic changes was noted.

The residual prostate was symmetrically normal in size with uniform parenchyma and slight coarse echotexture.

The area of the aortic trifurcation was free of pathology.

Normal size and margination were present in the kidneys. A normal 1:3 cortex / medulla ratio and normal corticomedullary definition were maintained. The echogenicity of the cortex was similar to or slightly less than normal liver parenchyma while the medulla echogenicity was hypoechoic to the cortex with no evidence of pelvic dilation. Potential for a small right kidney caudal cortical cyst is noted. The left kidney measured 6.6 cm in length. The right kidney measured 6.5 cm in length.

Adrenal Glands

The left adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The left adrenal gland measured 2.6 cm length x 0.57 cm width at the caudal pole. The right adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The right adrenal gland measured 3.5 cm length x 0.59 cm width at the caudal pole.

Spleen

The spleen exhibited a finely textured and homogenous parenchyma which was hyperechoic to the liver and renal cortical parenchyma. The capsule was smooth and regular without apparent expansion. The splenic vasculature at the hilus was normal in volume with no evidence of congestion or thrombosis. Acute to chronic inflammatory, neoplastic, or benign parenchyma changes were not noted. The spleen exhibited potential for borderline to mild generalized enlargement. No evidence of splenic infiltrative criteria or masses was noted.

Liver/ Gallbladder

The liver was subjectively normal in size, structure, and contour. The liver parenchyma was uniform and hypoechoic to the spleen with a mild coarse echotexture. The hepatic and portal vasculature were normal in appearance without signs of congestion. The gallbladder was non-distended in size with thin walls and primarily anechoic luminal content. The cystic and common bile ducts were normal.

PATIENT

Gastrointestinal

Gus Brandenburg

The stomach presented intact wall layering with a normal wall layer ratio. The lumen of the stomach contained moderate nonshadowing ingesta/chyme without signs of obstruction or foreign material. No evidence of mechanical pyloric outflow obstruction was noted.

SPECIES

Canine

The small intestine presented intact wall layering with 1:3 muscularis/mucosa ratio. The lumen of the small intestine was empty with no signs of ileus, obstruction, or foreign material.

BREED

Golden Retriever

Normal visible colon wall layers were present with apparent formed feces in lumen.

SEX

NM

Pancreas

The parenchyma of the left limb, body, and right limb of the pancreas presented isoechoic to the adjacent omental fat. A normal curvilinear capsule contour of the pancreas was present. The visible pancreatic duct was normal. No signs of active inflammation or neoplastic disease were evident.

AGE

9 years

Free Abdomen

No omental masses, lymphadenopathy, or evidence of peritoneal free fluid were noted.

WEIGHT

76 lbs.

ULTRASONOGRAPHIC FINDINGS

- Normal spleen with potential borderline to mild benign splenomegaly
- Gastric ingesta - likely recent meal ingestion

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of visceral pathology, specifically no evidence of splenic neoplastic criteria or masses. Potential for incidental minor splenic hyperplasia, hematopoiesis, or incidental splenitis possible. This is considered a normal patient variant.
