

|  |  |
|--|--|
| <b>PATIENT</b>   | <b>PRESENTING CLINICAL SIGNS</b>   |
| Sibyl Mulligan   | History of recent MCT, radiographs showed hepatomegaly, metastasis check, normal liver lab values.   |
| <b>SPECIES</b>   | <b>ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN</b>   |
| Canine   | <b>Urinary System</b>  |
| <b>BREED</b>   | The urinary bladder, trigone, cystourethral junction, and visible pelvic urethra to a depth of 3 cm exhibited normal thickness and tone. Anechoic urine was present in the lumen with no uroliths or sediment. The ureteral papillae were normal. The ureters were not visible which is normal. No evidence of inflammatory or neoplastic changes were noted.  |
| Mixed  | Normal size and margination were present in the kidneys. A normal 1:3 cortex / medulla ratio and normal corticomedullary definition were maintained. The echogenicity of the cortex was similar to or slightly less than normal liver parenchyma while the medulla echogenicity was hypoechoic to the cortex with no evidence of pelvic dilation. The left kidney measured 5.9 cm in length. The right kidney measured 6.0 cm in length. |
| <b>SEX</b>   | The area of the aortic trifurcation was free of pathology.   |
| FS   | The area of the iliac trifurcation was free of pathology including no evidence of medial, iliac or sublumbar lymphadenopathy.  |
| <b>AGE</b>   | <b>Adrenal Glands</b>  |
| 8yr  | The left adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The left adrenal gland measured 0.59 cm width at the caudal pole and 1.9 cm length. The right adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The right adrenal gland measured 0.68 cm width at the caudal pole and 2.2 cm length.  |
| <b>WEIGHT</b>  | <b>Spleen</b>  |
| 60.2lb   | The spleen exhibited a finely textured and homogenous parenchyma which was hyperechoic to the liver and renal cortical parenchyma. The capsule was smooth and regular without apparent expansion. The splenic vasculature at the hilus was normal in volume with no evidence of congestion or thrombosis. Acute to chronic inflammatory, neoplastic, or benign parenchyma changes were not noted.  |
| <b>INTERPRETED BY</b>                                    | <b>Liver</b>   |
| R. McKenzie Daniel,<br>DVM, DABVP<br>(Canine and Feline) | The liver was subjectively normal in size, structure, and contour. The liver parenchyma was uniform and hypoechoic to the spleen with a mild coarse echotexture. The hepatic and portal vasculature were normal in appearance without signs of congestion. The gallbladder was non-distended in size with thin walls and primarily anechoic luminal content. The cystic and common bile ducts were normal.                               |
| <b>IMAGING PERFORMED BY</b>                              | <b>Gastrointestinal</b>  |
| Kelly Vazquez  | The stomach presented intact wall layering with a normal wall layer ratio. The lumen of the stomach contained minor retained fluid and luminal gas with no signs of ileus, obstruction or foreign material.  |
| <b>HOSPITAL NAME</b>                                     | <b>Pancreas</b>  |
| Englewood Vet<br>Center                                  | The small intestine presented intact wall layering with 1:3 muscularis/mucosa ratio. The lumen of the small intestine was empty with no signs of ileus, obstruction or foreign material.   |
| <b>REFERRING VET</b>                                     | Normal visible colon wall layers were present with apparent formed feces in lumen.   |

**PATIENT**

Sibyl Mulligan

The parenchyma of the left limb, body and right limb of the pancreas presented isoechoic to the adjacent omental fat. A normal curvilinear capsule contour of the pancreas was present. The visible pancreatic duct was normal. No signs of active inflammation or neoplastic disease was evident.

**SPECIES**

Canine

**Free Abdomen**

No omental masses, overt lymphadenopathy or peritoneal effusion was present.

**BREED**

Mixed

**ULTRASONOGRAPHIC FINDINGS**

- Sonographically normal abdomen

**SEX**

FS

No evidence of visceral pathology including no evidence of primary or metastatic neoplastic criteria. Sonographic monitoring of the abdomen based on oncology recommendations is suggested.

**AGE**

8yr

**WEIGHT**

60.2lb

**INTERPRETED BY**
