

PATIENT	PRESENTING CLINICAL SIGNS
Rosie Sosely	re check prev u/s 11/3
SPECIES	ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN
Canine	Urinary System
BREED	The urinary bladder and visible pelvic urethra to a depth of 3.0 cm exhibited normal thickness and tone. Current normal wall without evidence of previously noted potential thickened apical urinary bladder wall or tumors. Anechoic urine was present in the lumen with no evidence of previously noted hyperechoic to mineralized urine sediment. The trigone and cystourethral junction were free of obvious pathology. The ureteral papillae were normal. The ureters were not visible which is normal. No evidence of inflammatory or neoplastic change were noted.
Lab Mix	
SEX	
Spayed Female	Normal size and margination was present in the kidneys. A normal 1:3 cortex / medulla ratio and normal corticomedullary definition were maintained. The echogenicity of the cortex was similar to or slightly less than normal liver parenchyma while the medulla echogenicity was hypoechoic to the cortex with no evidence of pyelectasia. The left kidney measured 6.1 cm in length. The right kidney measured 6.6 cm in length.
AGE	
3	
WEIGHT	Adrenal Glands
90	The left adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The left adrenal gland measured 0.58 cm width at the caudal pole. The right adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The right adrenal gland measured 0.63 cm width at the caudal pole.
INTERPRETED BY	Spleen
R. McKenzie Daniel, DVM, DABVP	The spleen exhibited a finely textured and homogenous parenchyma which was hyperechoic to the liver and renal cortical parenchyma. The capsule was smooth and regular without apparent expansion. The splenic vasculature at the hilus was normal in volume with no evidence of congestion or thrombosis. Acute to chronic inflammatory, neoplastic, or benign parenchyma changes were not noted.
IMAGING PERFORMED BY	
Jenn	
HOSPITAL NAME	Liver
Rockaway Animal Hospital	The liver was subjectively normal in size, structure, and contour. The liver parenchyma was uniform and hypoechoic to the spleen with a mild coarse echotexture. The hepatic and portal vasculature were normal in appearance without signs of congestion. The gallbladder was non-distended in size with thin walls and primarily anechoic luminal content. The cystic and common bile ducts were normal.
REFERRING VET	Gastrointestinal
Dr. Maniar	The stomach presented intact wall layering with a normal wall layer ratio. The lumen of the stomach was empty with no signs of ileus, obstruction or foreign material.
INVOICE	
12123	
DATE	
11/07/25	The small intestine presented intact wall layering with 1:3 muscularis/mucosa ratio. The lumen of the small intestine was empty with no signs of ileus, obstruction or foreign material. Normal visible colon wall layers were present with apparent formed feces in lumen.

PATIENT

Pancreas

Rosie Sosely

The parenchyma of the left limb, body and right limb of the pancreas presented isoechoic to the adjacent omental fat. A normal curvilinear capsule contour of the pancreas was present. The visible pancreatic duct was normal. No signs of active inflammation or neoplastic disease was evident.

SPECIES

Canine

Free Abdomen

BREED

Lab Mix

No overt lymphadenopathy or peritoneal effusion was present.

SEX

Spayed Female

ULTRASONOGRAPHIC FINDINGS

- Sonographically normal urinary bladder containing anechoic urine, normal visible proximal urethra.
- Normal bilateral kidneys.

AGE

3

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of previously noted urine sediment or potentially thickened apical urinary bladder wall. Correlation with current urinalysis and urinary signs is recommended.
