

## PATIENT

Toby Binstein

## PRESENTING CLINICAL SIGNS

2/6 heart murmur- pre anesthetic

## SPECIES

Feline

## ULTRASONOGRAPHIC EXAMINATION OF THE HEART

## BREED

DSH

## SEX

MN

## AGE

4y, 10m

## WEIGHT

11 lbs.

## Cardiac Presentation

The echocardiogram in this patient demonstrated normal **left atrial** size based on 3 separate LA measurements. The cranial and caudal **mitral** valve leaflets presented normal linear structure and kinetics. The **left ventricle** presented normal thicknesses with linear contour and was not dilated nor restricted. The **myocardium** presented normal echogenicity without subjective evidence of significant fibrotic or ischemic disease. **Contractility** of the ventricular walls was adequate and in normal range for this patient evidenced by the fractional shortening measurement and subjective evaluation of the different regions and angles of the myocardium. The **left ventricular outflow** tract demonstrated normal laminar flow and subjective structural integrity. The **right atrium** and auricle revealed normal size, structure and content. No evidence of masses was noted or chamber overload. **Tricuspid** valvular assessment demonstrated adequate linear morphology and kinetics. The **right ventricle** was of normal size (1/3 diameter of LV), chordae structure, myocardial echogenicity and thickness. **Pulmonic** tract assessment revealed normal valve structure, laminar flow, and diameter (approx. 1:1 pa/ao ratio). No visible **pericardial** or free pleura fluid was noted or extra cardiac pathology in the visible planes. The cranial **mediastinum and pericardial regions** were free of masses in the visible window.

## ULTRASONOGRAPHIC FINDINGS

- Normal echocardiogram

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of structural or functional cardiomyopathy including no evidence of left or right heart chamber enlargement, significant valvular insufficiencies, HCM criteria, or evidence of pulmonary hypertension. Assuming no evidence of dehydration or anemia, a benign physiologic / flow murmur is probable. Regardless, no indication for cardiac medications, given no evidence of structural or functional cardiomyopathy. No anesthetic contraindications.

Conservative monitoring of the murmur is recommended with recheck echocardiogram suggested in 12 months, sooner if murmur intensity increases or if clinical signs arise.

Suggested anesthetic protocol may include opioid or Benzodiazepine pre-med, induction with Propofol or Alfaxalone, and appropriate gas anesthesia with avoidance of alpha 2 agonists.
