PRESENTING CLINICAL SIGNS

Routine

Abnormal PE/Chem/CBC/UA Results: CBC/Chem =wnl

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder, trigone, cystourethral junction, and visible pelvic urethra to a depth of 4.0 cm exhibited normal thickness and tone. Anechoic urine was present in the lumen with no uroliths or sediment. The ureteral papillae were normal. The ureters were not visible which is normal. No evidence of inflammatory or neoplastic changes was noted.

No evidence of pathology was noted in the area of the uterine remnant.

No evidence of pathology in the area of the aortic trifurcation.

Normal size and margination were present in the kidneys. A normal 1:3 cortex / medulla ratio was maintained. The medulla and cortices were uniform in texture with some increased echogenicity and mild to moderate loss of corticomedullary symmetry and definition expected for the age of the patient. No evidence of pelvic dilation was present. The left kidney measured 6.5 cm in length. The right kidney measured 6.7 cm in length.

Adrenal Glands

The left adrenal gland was indistinctly visualized exhibiting subtle capsule asymmetry and mild nonhomogeneous parenchyma consistent with age-related adrenal changes, measuring 1.1 cm width. The right adrenal gland was not definitively visualized.

Spleen

The spleen exhibited a finely textured and homogenous parenchyma which was hyperechoic to the liver and renal cortical parenchyma. The capsule was smooth and regular without apparent expansion. The splenic vasculature at the hilus was normal in volume with no evidence of congestion or thrombosis. Acute to chronic inflammatory, neoplastic, or benign parenchyma changes were not noted.

Liver/ Gallbladder

The liver was subjectively normal in size, structure, and contour. The liver parenchyma was mildly nonuniform and hypoechoic to the spleen with a moderate coarse echotexture and subjective mild to benign parenchymal remodeling. The hepatic and portal vasculature were normal in appearance without signs of congestion. The gallbladder was non-distended in size containing anechoic content with minor hyperechoic gallbladder sediment. The cystic and common bile ducts were normal. No evidence of gallbladder inflammatory criteria was noted.

Gastrointestinal

The stomach presented intact wall layering with a normal wall layer ratio. The lumen of the stomach was empty with no signs of ileus, obstruction, or foreign material.

The small intestine presented intact wall layering with 1:3 muscularis/mucosa ratio. The lumen of the small intestine was empty with no signs of ileus, obstruction, or foreign material.

PATIENT

Normal visible colon wall layers were present with apparent formed feces in lumen.

Remmy Wilson

Pancreas

SPECIES

The parenchyma of the left limb, body, and right limb of the pancreas presented isoechoic to the adjacent omental fat. A normal curvilinear capsule contour of the pancreas was present. The visible pancreatic duct was normal. No signs of active inflammation or neoplastic disease were evident.

Canine

BREED

Free Abdomen

Golden Ret.

No omental masses, lymphadenopathy, or evidence of peritoneal effusion were noted.

SEX

ULTRASONOGRAPHIC FINDINGS

FS

- Mild to moderate chronic renal changes

AGE

- Sonographically normal spleen

12 years

- Mild hepatic parenchymal remodeling

WEIGHT

- Minor gallbladder sediment (non mucocoele)

82

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Geriatric abdomen without evidence of significant visceral pathology.
