9-15-22

**PRESENTING CLINICAL SIGNS**

Elevated ALT - Incidental finding on yearly lab work. Another dog in the same litter has liver shunt per owner.

Abnormal PE/Chem/CBC/UA Results: ALT (138). Bile acids: pre 25.4; post 30.5

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The urinary bladder, trigone, cystourethral junction, and visible pelvic urethra to a depth of 2.0 cm exhibited normal thickness and tone. Anechoic urine was present in the lumen with no sediment or calculi. The ureteral papillae were normal. The ureters were not visible which is normal. No evidence of inflammatory or neoplastic changes was noted.

The residual prostate was free of pathology, measuring 0.79 cm in diameter.

The area of the aortic trifurcation was free of pathology.

Normal size and margination were present in the kidneys. A normal 1:3 cortex / medulla ratio and normal corticomedullary definition were maintained. The echogenicity of the cortex was similar to or slightly less than normal liver parenchyma while the medulla echogenicity was hypoechoic to the cortex with no evidence of pelvic dilation. The left kidney measured 4.3 cm in length. The right kidney measured 4.9 cm in length.

**Adrenal Glands**

The left adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The left adrenal gland measured 0.41 cm width at the caudal pole and 0.37 cm width at the cranial pole. The right adrenal gland was uniform in size and contour with a uniformly hypoechoic parenchyma. The right adrenal gland measured 0.48 cm width at the caudal pole and 0.48 cm width at the cranial pole.

**Spleen**

The spleen exhibited a finely textured and homogenous parenchyma which was hyperechoic to the liver and renal cortical parenchyma. The capsule was smooth and regular without apparent expansion. The splenic vasculature at the hilus was normal in volume with no evidence of congestion or thrombosis. Acute to chronic inflammatory, neoplastic, or benign parenchyma changes were not noted.

**Liver/ Gallbladder**

The liver was subjectively normal in size, structure, and contour. The liver parenchyma was uniform and hypoechoic to the spleen with a mild coarse echotexture. The hepatic and portal vasculature were normal in appearance without signs of congestion. Normal subjective hepatic vascular volume was noted. The visualized portal vein appeared to be sonographically unremarkable. The gallbladder was non-distended in size with thin walls and primarily anechoic luminal content. The cystic and common bile ducts were normal.

**PATIENT**

***Gastrointestinal***

Rosko Andrade

The stomach presented intact wall layering with a normal wall layer ratio. The lumen of the stomach contained mild ingesta exhibiting areas of strong distal acoustic shadowing. No overt evidence of mechanical pyloric outflow obstruction were evident.

**SPECIES**

Canine

The small intestine presented intact wall layering with 1:3 muscularis/mucosa ratio. The lumen of the small intestine was empty with no signs of ileus, obstruction, or foreign material.

**BREED**

Canine

Normal visible colon wall layers were present with apparent formed feces in lumen.

**SEX**

MN

***Pancreas***

The parenchyma of the left limb, body, and right limb of the pancreas presented isoechoic to the adjacent omental fat. A normal curvilinear capsule contour of the pancreas was present. The visible pancreatic duct was normal. No signs of active inflammation or neoplastic disease were evident.

**AGE**

3 y

***Free Abdomen***

No overt lymphadenopathy or peritoneal effusion was present.

**WEIGHT**

19 lbs.

**ULTRASONOGRAPHIC FINDINGS**

- Low-grade hepatopathy - low-grade inflammatory hepatopathy, possible portal hypoplasia / microvascular dysplasia
- Strongly shadowing gastric ingesta

**INTERPRETED BY**

R. McKenzie Daniel, DVM,  
 DABVP (Canine and  
 Feline)

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

No evidence of intrahepatic or extrahepatic shunting was noted. Subjective normal portal vein volume, as well as normal overall hepatic volume. Screening hepatic FNA cytology could be considered to assess for possible inflammatory cell type. Core surgical biopsy is likely indicated for further definition as to whether primary parenchymal disease or portal hypoplasia / microvascular dysplasia is present. Hepatosupportive medications +/- some or all of the following protocol could be considered empirically.

**IMAGING**

**PERFORMED BY**

Pamela Harrigan, RDCS

**HOSPITAL NAME**

Anchor Animal  
 Hospital

The strongly shadowing gastric ingesta is nonspecific, likely indicative of strongly shadowing food. Potential for gastric foreign material is considered a less likely differential diagnosis. Monitoring for evidence of normal gastric emptying could be considered if clinically indicated.

**REFERRING VET**

Kristen Lavin, DVM

**Royal Canin Hepatic Support diet or Hills L/D, Metronidazole** (7.5 mg/kg PO bid) over the next 14 days, **Lactulose** (Oral: 3.1-3.7 g/5 ml lactulose in a syrup base) long term to target 2-3 soft stools/day, with a **high-quality protein supplement** of minor amount of **yogurt** or **cheddar cheese**. Monitor bile acids, with attention paid to dropping albumin, BUN or cholesterol. SAME and nutraceuticals as needed. **Ursodiol** (10-15 mg/kg p.o. q24h) can be considered as hepatoprotectant and to enhance bile flow. **Zinc** serum level keep between 200—500 ug/dl. If deficient then Tx zinc acetate 1-3 mg/kg/day. Gastrointestinal protectants are recommended if the patient is anorexic.
