

PATIENT

Benson Poliquin

PRESENTING CLINICAL SIGNS

Vomiting/regurgitation, fever, increased respiration rate and respiratory sounds. Had a biopsy done about 5 days ago for lymph node enlargement. Eating less.

SPECIES

Canine

RADIOGRAPHIC FINDINGS

Thorax

The pulmonary inflation is deep. A moderate generalized unstructured interstitial lung pattern with enhancement of the bronchi is seen.

BREED

Poodle Mix

The radiographic presentation of the cardiac silhouette is within normal limits. No evidence of a vascular pattern or cardiogenic pulmonary edema is seen.

SEX

MN

There is mild esophageal aerophagia. No evidence of abnormal esophageal dilation is noted.

There is no radiographic evidence of mediastinal lymphadenomegaly. Mild sternal lymphadenomegaly appears to be a potential.

AGE

5

RADIOGRAPHIC DIAGNOSIS

- Diffuse unstructured interstitial lung pattern.
- Potential for sternal lymphadenomegaly.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Differential diagnosis for the interstitial lung pattern includes noncardiogenic pulmonary edema, interstitial pneumonia, and infiltrative disease such as lymphoma. Pulmonary fibrosis is thought an unlikely differential diagnosis here owing to the deep inflation of the lung. The overall opacity of the lung may be slightly enhanced by positional atelectasis of the left lung which is associated with mild mediastinal shift and likely transient.

HOSPITAL NAME

Sunridge Vet Clinic

The sternal lymphadenomegaly may represent reactive hyperplasia versus infiltrative disease. No evidence of cranial mediastinal or tracheobronchial lymphadenomegaly is seen radiographically.

REFERRING VET

Magill

Ultrasound guided FNA of the lung could be considered for further definition vs airway sampling.
