

**PATIENT**

Rex Godber

**PRESENTING CLINICAL SIGNS**

Dyspnea, coughing, inappetence, BAR, TPR WNL.

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE THORAX**

Right/left lateral and ventrodorsal views totaling 3 images available for review.

**BREED**

Beagle Mix

**RADIOGRAPHIC FINDINGS**

The lungs are deeply inflated. The ribcage is expanded.

**SEX**

Male Neutered

A severe increase in pulmonary opacity is noted with a multinodular interstitial appearance. There also is marked generalized peribronchial cuffing. The changes are mostly evenly distributed throughout the lung. No evidence of concurrent mediastinal lymphadenomegaly is noted.

The assessment of the cardiac silhouette is obscured; however, as far as assessable, the cardiac silhouette presents within normal limits.

**AGE**

8 Years

Course and width of the trachea are considered within normal limits.

**RADIOGRAPHIC DIAGNOSIS**

- Severe structured interstitial lung pattern with nodular and miliary appearance.

**INTERPRETED BY**Nele Eley, DVM  
Dr. med. Vet. DipECVDI**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic changes are highly suggestive for secondary neoplasia of the lung such as metastatic disease of another primary tumor, round cell infiltrate, or other. The possibility of granulomatous lung disease such as fungal, mycobacterial, or eosinophilic cannot be ruled out entirely but is thought less likely. Consider airway endoscopy with airway sampling versus direct ultrasound guided fine needle aspiration of the lung for further definition.
