

PATIENT PRESENTING CLINICAL SIGNS

Jasper Coyle SC mass 10x12x12cm right chest

SPECIES

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE THORAX

Post contrast study available for review only.

COMPUTED TOMOGRAPHIC FINDINGS

BREED

Mixed

The subcutaneous soft tissue mass is located caudal to the right scapula along the right cranioventral thoracic wall measuring approximately 10 by 12 by 12 cm. The lesion appears ill-defined, uniform with moderate enhancement and confined to the soft tissues.

No evidence of intrathoracic extension is seen.

SEX

MN

There is no evidence of nodular lesions or other parenchymal abnormalities of the lung

The regional lymph nodes in the right axillary and mediastinum region are normal in size and appearance.

AGE

7yr

The body condition score is elevated.

COMPUTED TOMOGRAPHIC DIAGNOSIS

INTERPRETED BY

Nele Eley (Ondreka),
DVM Dr. med. vet.,
DipECVDI

- Large subcutaneous thoracic wall mass caudal to the right scapula.
- No evidence of metastatic pulmonary lymph node disease

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS

HOSPITAL NAME

Animal Surgical
Oceanside

The CT study reveals a soft tissue mass meeting neoplastic criteria in the right cranioventral thoracic wall caudal to the scapula with no evidence of intrathoracic extension. Primary soft tissue neoplasia such as sarcoma is considered most likely. The lesion is directly adjacent to the ribs and intercostal space however direct involvement of the osseous thoracic structures or rib cage is not seen.

Benign neoplasia is a possible yet less likely differential diagnosis. The findings are not compatible with an abscess.

REFERRING VET

Dr Infernuso

Tissue sampling is recommended for further definition and to plan treatments such as surgical excision accordingly.
