RADIOGRAPHIC STUDY OF THE ABDOMEN

Lateral and ventrodorsal views totaling 2 images available for review.

BREED

Mixed

RADIOGRAPHIC FINDINGS

A series of spondyloses are seen within the thoracolumbar spine and lumbosacral junction.

SEX

FS

The abdominal cavity is voluminous with pendulous ventral abdominal wall.

Mild generalized enlargement of the liver with slightly rounded lobar margins is seen.

The spleen, kidneys, and urinary bladder present within the expected limits.

The stomach is post-prandial.

AGE

8 Years

The small intestinal loops are evenly distributed throughout the mid abdomen.

The cecum and colon contain a moderate amount of fecal material.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Pendulous ventral abdominal wall.
- Generalized hepatomegaly.
- Multiple spondyloses - unrelated to the reason of clinical presentation.

HOSPITAL NAME

New Bridge
Veterinary Practice

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The main radiographic finding is the mild diffuse enlargement of the liver. Underlying causes include endocrine/metabolic hepatopathy, hepatitis, storage diseases, and diffuse infiltrative disease. Correlation with the laboratory values is necessary for further definition. An abdominal ultrasound appears reasonable in the further workup of this patient as well in order to further assess for potential adrenal gland changes, structural changes of the liver, and obtain parenchymal samples if indicated per the laboratory values and potential ultrasonographic changes.
