Male

**RADIOGRAPHIC STUDY OF THE RIGHT FRONT PAW**

**AGE**

8 Years, 2 Months

Mediolateral flexed view of the right front paw and dorsopalmar view of both front paws totaling 2 images available for review.

**RADIOGRAPHIC FINDINGS**

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

The osseous anatomy of the right front paw presents within normal limits. No evidence of traumatic osseous injury, osteoarthritis, or aggressive bone lesions is identified.

There is no evidence of joint subluxation or luxation.

The left front paw presents with in normal limits as well.

**HOSPITAL NAME**

DPC Veterinary  
Hospital

Focal interosseous radioulnar synostosis is seen in the mid diaphyseal third and considered within normal limits.

There appears to be decubital soft tissue swelling in the region of the caudal right elbow.

**REFERRING VET**

Dr. White

**RADIOGRAPHIC DIAGNOSIS**

- Radiographically normal right front paw.

**INVOICE**

49598

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic presentation of the right front paw is within normal limits. Lameness of other origin including cervical neurologic disease, soft tissue trauma, or inflammation are potential considerations in this patient.
