

**PATIENT**

Chesney Cabral

**PRESENTING CLINICAL SIGNS**

Presented for continued weight loss and overall ADR. P has history of 5lb weight loss over the 3 weeks. P has been having intermittent loose stool/diarrhea and decreased appetite. History of CKD stage 2, fairly stable in the past

**SPECIES**

Canine

Abnormal PE/Chem/CBC/UA Results: Creatinin 1.8, ALB 1.8 Resting cortisol pending - screening for atypical addisons

**RADIOGRAPHIC STUDY OF THE ABDOMEN**

**BREED**

Poodle

Right/left lateral and ventrodorsal views totaling 3 images available for review.

**RADIOGRAPHIC FINDINGS**

**SEX**

FS

Multiple spondyloses are seen throughout the thoracolumbar spine.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

**AGE**

14.6 Years

The abdominal serosal detail appears to be mildly reduced caudal of the stomach which, however, may be a consequence of intestinal crowding.

Mild generalized hepatomegaly appears to be present.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

**HOSPITAL NAME**

Boca Park Animal  
Hospital

Mild caudodorsal deviation of the gastric pylorus is seen. The stomach and small intestine present mild aerophagia.

The small intestinal loops are turgid in appearance.

The colon is seen in the expected position and presents with appropriate content.

**REFERRING VET**

Ashman

**RADIOGRAPHIC DIAGNOSIS**

- Mild generalized hepatomegaly.
- Gastrointestinal maldigestion pattern.
- Spondyloses - unrelated to the reason of clinical presentation.

**INVOICE**

49765

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**DATE**

1-22-22

Differential diagnosis for the hepatomegaly includes endocrine/metabolic hepatopathy. Diffuse infiltrative disease cannot be ruled out entirely. Correlate with the laboratory values and consider further evaluation by means of ultrasound to screen for echoarchitectural changes of the abdominal organs with greater sensitivity.

**PATIENT**

Chesney Cabral

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

**SPECIES**

Canine

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.

**BREED**

Poodle
