

PATIENT

Vedder Ladich

PRESENTING CLINICAL SIGNS

3 view thoracic radiographs for review. Screening for aspiration pneumonia and metastasis.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Right/left lateral and ventrodorsal views totaling 3 images available for review.

BREED

Labrador Retriever

RADIOGRAPHIC FINDINGS

The patient appears to be mildly obese.

Severe bilateral elbow osteoarthritis is seen. There is mild bilateral shoulder osteoarthritis. Degenerative changes of the sternum and costochondral junctions are present as well as multiple thoracic spondyloses.

SEX

MN

The degree of pulmonary inflation is fair. A mild generalized bronchointerstitial pattern is seen. Mild diffuse increase in interstitial opacity appears to be present in the right lung which is likely secondary to prior positioning of the patient in right lateral recumbency. There is no evidence of pulmonary nodules or masses. Age related incidental pulmonary osteomas are seen.

AGE

14 Years, 8 Months

There appears to be an abundance of mediastinal fat. No evidence of pathologic mediastinal widening is noted.

Course and width of the trachea are considered within normal limits.

The radiographic presentation of the cardiac silhouette is within normal limits.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Normal age related thorax.
- Multiple spondyloses.
- Elbow and shoulder osteoarthritis.

HOSPITAL NAME

Tahoe Integrative
Veterinary Care

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no evidence of aspiration pneumonia, pulmonary nodules, or masses. The mild increase in interstitial and bronchial enhancement may well be within the age related normal limits. Further evaluation would only be indicated in case of pertinent clinical signs.
