

**PATIENT**

Aussie Pett

PRESENTING CLINICAL SIGNS

Vomiting started earlier today, vomited around 5-6 times. No D/C On Raw diet started two weeks ago. History of chewing into things. Lethargic.
Abnormal PE/Chem/CBC/UA Results: blood work in house- mild dehydration, decreased potassium, rest is unremarkable

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right lateral and ventrodorsal views totaling 2 images available for review. The 3rd view was corrupt.

BREED

Labradoodle

RADIOGRAPHIC FINDINGS

The stomach is distended with a large amount of fluid and gas. There is a semicircular mineral opacity seen on the right lateral view which appears to be situated within the distended stomach. A moderate amount of mineral opaque gravel is seen in the gastric fundus on both orthogonal views.

SEX

Male Neutered

The small intestine is turgid in appearance with a mix of gas and soft tissue opaque content. No significant small intestinal dilation is seen. No definitive plication and no radiopaque foreign material can be seen within the small intestine.

AGE

2 Years

RADIOGRAPHIC DIAGNOSIS

- Distended stomach with gastric foreign material.
- Suspect functional small intestinal ileus.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings are highly suggestive for the presence of gastric foreign material at the time of the examination which may have progressed into the small intestine in the meantime. Consider radiographic recheck or ultrasound for further definition to further plan the potential foreign body removal as indicated.
