

**PATIENT**

Andretti George

**PRESENTING CLINICAL SIGNS**

Lame on Dec 24 on the front left, xrays taken without sedation  
Abnormal PE/Chem/CBC/UA Results: painful mid way on the radius and ulna 1 week later  
after on pain meds slight improvement but still limping

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE LEFT FRONT LIMB**

Craniocaudal oblique views of the left elbow and dorsopalmar views of the left carpus totaling 4 images available for review.

**BREED**

Cain Corso

**RADIOGRAPHIC FINDINGS**

Moderate soft tissue swelling is seen medial to the distal left radius and level with the medial aspect of the left antebrachiocarpal joint.

**SEX**

Male

There is no evidence of osseous injury of the carpal bones.

The view of the elbow is rotated; however, there appears to be a small, isolated bone fragment in the medial aspect of the left elbow joint.

**AGE**

5

**RADIOGRAPHIC DIAGNOSIS**

- Left carpal soft tissue swelling accentuating the medial aspect.
- Potential for fragmentation of the medial coronoid process or other medial bone fragment in the left elbow.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The main finding appear to be the soft tissue swelling medial of the left carpus level with the antebrachiocarpal joint. Consider edema, hematoma, and ligamentous injury a potential. Correlate with the clinical palpation and consider stressed radiographs for further definition.

**HOSPITAL NAME**

Chappelle Veterinary  
Clinic

Orthogonal views of the left elbow should be obtained in order to rule out elbow dysplasia or other osseous pathology.
