

PATIENT

Zoey Duran

PRESENTING CLINICAL SIGNS

Patient has mammary masses on the right first chain. The chest rads are for met check in preparation for mass removal surgery
 Abnormal PE/Chem/CBC/UA Results: 8 x 6 cm mammary mass on the right ventral cranial thorax

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Right lateral and ventrodorsal views totaling 2 images available for review.

BREED

Maltese

RADIOGRAPHIC FINDINGS

A large right ventral thoracic wall mass is seen and compatible with the history of mammary mass.

SEX

S

The mamils are prominent.

The sternal lymph node is moderately enlarged with an extrapleural sign.

AGE

9 Years

Multiple soft tissue opaque variably sized interstitial pulmonary nodules are distributed throughout the lung field.

There is mild aerophagia.

INTERPRETED BY

Nele Eley, DVM
 Dr. med. Vet. DipECVCI

Bilateral shoulder osteoarthritis is noted.

RADIOGRAPHIC DIAGNOSIS

- Multiple interstitial pulmonary nodules
- Sternal lymphadenomegaly
- Mammary mass
- Bilateral shoulder osteoarthritis.

HOSPITAL NAME

Petroglyph Animal Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals multiple interstitial pulmonary nodules compatible with metastatic disease. Metastasizing mammary carcinoma is considered a primary differential diagnosis.

The enlarged sternal lymph node is likely to represent a metastases as well since the sternal lymph node drains part of the thoracic wall.
