

**PATIENT**

Miska Buessler

PRESENTING CLINICAL SIGNS

Intermittent forelimb lameness over last 3-4 months with most recent episode worse than others. Physical exam was unremarkable other than patient is overweight.
Abnormal PE/Chem/CBC/UA Results: N/A

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ELBOWS & SHOULDERS

Mediolateral flexed views of the shoulders and elbows, caudocranial views of the shoulders, craniocaudal views of the elbows and carpi, and lateral views of the carpi totaling 6 images available for review.

BREED

Bloodhound

Shoulder and elbow read requested.

SEX

Female Spayed

Elbows

The cranial contour of the medial coronoid process is well delineated in both elbows. There is no evidence of subtrochlear notch sclerosis.

AGE

4

Minimal osseous remodeling of the cranial aspect of the radial head and proximal contour of the anconeal process is seen in both elbows.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Shoulders

Both shoulders present within normal limits. There is no evidence of osteochondritis or osteoarthritic changes.

Mild osteophytes are present in the dorsal contour of the right radiocarpal bone.

HOSPITAL NAME

Cornelius Veterinary
Clinic

RADIOGRAPHIC DIAGNOSIS

- Normal age related elbows and shoulders.
- Mild right antebrachicarpal osteoarthritis.

REFERRING VET

H. Flint

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic presentation of the shoulder and elbows is within normal age related limits. The very subtle osseous remodeling of the anconeal processes and radius in both elbows is considered within normal limits.

INVOICE

47779

There appears to be early osteoarthritis of the right antebrachicarpal joint; however, these changes again are very subtle and clinical correlation is required in order to determine their clinical significance. Lameness of other origin due to soft tissue injury, inflammation, or neurologic disease are potential considerations in this patient as well.
