

**PATIENT**

Boris Walton

PRESENTING CLINICAL SIGNS

see report from 3/17/18. DM, mild proprioceptive deficits.

SPECIES

K9

COMPUTED TOMOGRAPHIC STUDY OF THE LUMBAR SPINE

Compared to prior study dated 3/16/2018.

BREED

German Shepherd

COMPUTED TOMOGRAPHIC FINDINGS

Progressive degenerative lumbosacral stenosis is noted with ventral subluxation of the sacrum with respect to the 7th lumbar vertebra. There is moderate intervertebral disc protrusion of the lumbosacral disc with reduced intervertebral disc space width and progressive spondylosis deformans. Bilateral neuroforaminal narrowing is seen at the lumbosacral junction as well which is moderate in degree and slightly more pronounced on the left when compared with the right side.

SEX

MN

Mild smooth new bone formation of the iliosacral joints is noted.

AGE

10 Years

The L5/6 and L6/7 protrusions appear to be stable.

Mild progression of spondyloses is seen at T12/13, T13/L1, L1/2, and L2/3.

There is mild intervertebral disc protrusion at L1/2.

INTERPRETED BYNele Eley, DVM
Dr. med. Vet. DipECVDI

Stationary left sided L6/7 facet joint hypoplasia is noted.

Both coxofemoral joints present mild degenerative changes.

COMPUTED TOMOGRAPHIC DIAGNOSIS**HOSPITAL NAME**Animal Medical
Center of Mt.
Pleasant

- Progression of the degenerative lumbosacral stenosis to moderate stenosis with bilateral neuroforaminal involvement.
- Stationary mild protrusions L6/7, L5/6, and L1/2.
- Multiple mild spondyloses.
- Early degenerative joint disease of the coxofemoral joints.

REFERRING VET

Dr. Steven Epstein

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The main finding is the degenerative lumbosacral stenosis with moderate intervertebral disc protrusion, mild ventral subluxation of the sacrum, and bilateral neuroforaminal stenosis, left more than right, which may well correlate with the patient's clinical signs. The remainder of the changes are considered mild and relatively stable compared to the prior study.
