

PATIENT

Doug Stock

PRESENTING CLINICAL SIGNS

losing weight , concern about abdominal neoplasia
Abnormal PE/Chem/CBC/UA Results: unremarkable

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views totaling 3 images available for review.

BREED

Boxer

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Male Neuter

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

AGE

5 Years

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

HOSPITAL NAME

St. Catharine's Animal
Hospital

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal abdomen.

REFERRING VET

Dr. Boctor

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

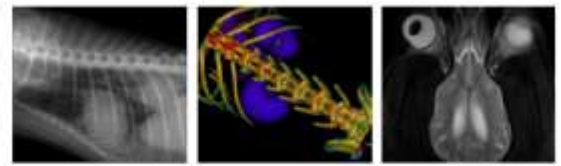

No evidence of a mass effect and no other structural abnormality is noted on the radiographic study of the abdomen. A more detailed assessment by abdominal ultrasound could be considered in order to rule out radiographically occult structural disease. However, based on the radiographs alone, an abdominal mass is not suspected.
