**PRESENTING CLINICAL SIGNS**

Dog started favoring the left rear leg several months ago. Dog would limp on the left rear leg after playing hard and then with rest for a few days it would then improve. This happened about 6 times. The latest episode the dog has not improved with rest. Now just toeing the left rear legs down

Abnormal PE/Chem/CBC/UA Results: Pre Sx Bloods: CBC: WNL. Chem:Lipa 2103 (N 200-1800) Vet Scan VS Pro PT 18.6 Sec (N 14-19) aPTT 113.1 Sec (N 75-105) Full Cranial drawer and CTT, CCL injury

**ULTRASONOGRAPHIC FINDINGS****Left Stifle**

Moderate effusion and synovial swelling are seen within the left supra- and infra- patellar recesses. There is moderate osseous remodeling of the visible periarticular margins noted.

The cranial cruciate ligament presents as a well delineated "smooth" and hyperechoic stump at the intercondylar eminence of the tibia with a well delineated hypoechoic halo.

The lateral and medial menisci are in situ, well aligned with the bone surfaces, and of uniform internal echoarchitecture.

**ULTRASONOGRAPHIC DIAGNOSIS**

- Moderate chronic osteoarthritis of the left stifle with chronic full rupture of the cranial cruciate ligament.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The ultrasonographic findings support longer standing rupture of the cranial cruciate ligament with a relatively short and well delineated stump of fibers at the intercondylar eminence which is "organized" in appearance. No evidence of concurrent meniscal injury was seen at this point.
