

**PATIENT**

Rocky Bloomberg

**PRESENTING CLINICAL SIGNS**

Rocky initially presented to the rDVM for hypercalcemia. Parathyroid panel was negative, left anal sac mass found on examination.

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE THORAX**

Right/left lateral and ventrodorsal views of the thorax totaling 3 images available for review.

**BREED**

Cocker Spaniel

**RADIOGRAPHIC FINDINGS**

Patient is under general anesthesia and intubated.

The patient is moderately obese.

**SEX**

MN

The degree of pulmonary inflation is fair. Multiple soft tissue opaque interstitial pulmonary nodules of varying size are seen throughout all lung lobes.

There is mild esophageal aerophagia.

**AGE**

10 Years

The cardiac silhouette is upright and thin with thin pulmonary vasculature and caudal vena cava.

No evidence of mediastinal lymphadenomegaly is noted.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

**RADIOGRAPHIC DIAGNOSIS**

- Nodular interstitial lung pattern.
- Hypovolemia with microcardia and underperfusion of the lung.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS****HOSPITAL NAME**

Animal Surgical  
Center

The radiographic findings are compatible with pulmonary metastatic disease and should be regarded so until proven otherwise. Theoretically, eosinophilic granuloma and other granulomatous pneumonia cannot be ruled out entirely. However, these are considered by far less likely in general and especially in light of the clinical history of the patient.
