

PATIENT

Marni Maczek

PRESENTING CLINICAL SIGNS

Two week history of hyporexia/anorexia. Will eat a food for a day or so and then quit eating it. Owner is offering a variety of foods and she will eat it once and then refuse it. Over the past several months, she has been less interested in food and required more encouragement. No Vomiting but has had some diarrhea, Hacking a couple times a week Not lethargic but not wanting to going on walks.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

BREED

Newfoundland

Lateral and orthogonal views of the thorax and abdomen totaling 5 images available for review.

RADIOGRAPHIC FINDINGS

SEX

FS

Thorax

A well delineated rounded 1.4 cm sized ossified structure is seen associated with one shoulder which also presents an isolated ossicle of the infraglenoid tubercle.

Multiple moderate to severe ventrally bridging spondyloses are present throughout the thoracic and lumbar spine.

AGE

12 Years, 2 Months

The degree of pulmonary inflation is moderate. A moderate generalized bronchointerstitial lung pattern is noted with even distribution throughout the lung. No evidence of pulmonary nodules or masses is seen.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDF

The radiographic presentation of the cardiac silhouette is considered within normal limits.

There is no evidence of abnormal mediastinal widening.

HOSPITAL NAME

Tahoe Intergrative
Veterinary Care

Course and width of the trachea present within normal limits.

Abdomen

The radiographic presentation of the spleen and kidneys is considered within normal limits.

REFERRING VET

Dr Wendy Robinson

The caudoventral contour of the liver is minimally irregular; however, no overall enlargement of the liver is seen.

The stomach is post-prandial.

INVOICE

47931

The small intestinal loops are evenly distributed throughout the mid abdomen and mildly turgid in appearance. No evidence of abnormal dilation, plication, or radiopaque foreign material is noted.

A mild amount of fecal material is seen within the colon.

DATE

10-22-21

RADIOGRAPHIC DIAGNOSIS

- Moderate bronchointerstitial lung pattern.
- Minimally irregular liver contour.

PATIENT

Marni Maczek

- Synovial osteochondromatosis and isolated infraglenoid tubercle in one shoulder.
- Multiple spondyloses.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

SPECIES

Canine

The moderate bronchointerstitial lung pattern may be within age related normal limits. However, low grade chronic lower airway disease such as eosinophilic / irritant bronchopneumopathy versus infectious bronchitis such as viral, bacterial, parasitic, or protozoal cannot be ruled out entirely.

BREED

Newfoundland

Minimal irregularity of the liver contour may be artifactual however, structural pathology such as nodular hyperplasia, presence of nodule, or emerging mass lesion cannot be ruled out entirely.

SEX

FS

Abdominal ultrasound could be considered to further verify the presence of hepatic changes depending on the correlation with the laboratory workup and also to further evaluate for potential underlying causes of the inappetence and diarrhea is this patient.

AGE

12 Years, 2 Months
