

**PATIENT**

Kitty Propeck

PRESENTING CLINICAL SIGNS

P presented for the onset of mild to moderate limping on the right hindlimb (based on the video provided from O).

Abnormal PE/Chem/CBC/UA Results: Only radiographs performed at this time P is ambulatory in the room and no signs of lameness are appreciated. Caudal extension of the right forelimb appears painful, but palpation is unrewarding.

RADIOGRAPHIC STUDY OF THE ELBOWS**BREED**

Siamese

Mediolateral and craniocaudal views of both elbows available for review.

RADIOGRAPHIC FINDINGS**SEX**

MN

Right Elbow

Trochlear notch sclerosis of the ulnar is seen. The medial coronoid process is ill-defined. A moderate amount of new bone is seen at the periarticular margins. There also are isolated new bone formations with smooth margins and layering.

AGE

13 Years

Left Elbow

Similar findings are present in the left elbow with a large amount of isolated bone structures with an average size of 2mm.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Both shoulders are included in the study and present within normal limits.

RADIOGRAPHIC DIAGNOSIS

- Moderate bilateral elbow osteoarthritis with multiple synovial osteochondromatosis.

HOSPITAL NAME

Boca Park Animal
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals bilateral elbow osteoarthritis with synovial osteochondromatosis which both is rather common in geriatric cats and of variable clinical significance. It is very typical for osteoarthritis in cats to present with intermittent clinical signs. Concurrent presence of soft tissue trauma, inflammation, or neurologic disease can obviously not be ruled out.
