RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views totaling 2 images available for review.

AGE

9 Years, 1 Month

RADIOGRAPHIC FINDINGS

Mild spondylosis deformans is noted in the cranial lumbar spine at L1/2.

Moderate enlargement of the prostate is seen. The prostate is of uniform opacity and well delineated.

No evidence of a sublumbar mass effect is noted.

Mild gastric aerophagia is noted.

The small intestinal loops are evenly distributed throughout the mid abdomen and of even diameter. No evidence of abnormal dilation, plication, or radiopaque foreign material is seen.

The colon contains a mild amount of fecal material.

The soft tissues level with the anus are mildly ill defined.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is no evidence of obstructive pathology throughout the gastrointestinal tract. The radiographic presentation of the gastrointestinal tract is within normal limits except for mild gastric aerophagia which, however, may also be due to excitement and is necessarily a sign of GI

PATIENT

pathology.

Tobbyspot Suarez

The radiographic presentation of the prostate would fit benign hyperplasia of the non-neutered male.
