

**PATIENT**

Sami Winbauer

PRESENTING CLINICAL SIGNS

Mass removed from left front forelimb, dx squamous cell carcinoma New large mass in left prescapular lymph node area Mets check

SPECIES

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE THORAX

Plain study available for review.

BREED

Labrador Retriever

COMPUTED TOMOGRAPHIC FINDINGS

Not all of the lung is included in the collimated field of view. Part of the left caudal, left cranial, right cranial, and right caudal lung lobes are outside the scanned field of view.

SEX

Female Spayed

The included lung reveals no evidence of interstitial nodules. Occasional age related incidental pulmonary osteomas are seen and there is multifocal bronchial wall thickening noted accentuating the right cranial lobe.

Mild to moderate mid thoracic spondyloses are seen.

AGE

8 Years, 6 Months

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Limited study.
- No pulmonary metastases seen in the scanned field of view.
- Generalized bronchial lung pattern with accentuation of the right cranial lung lobe.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

As far as seen, no interstitial pulmonary nodules are noted. There is a bronchial lung pattern which is accentuating the right cranial lung lobe. Consider irritant / allergic bronchopneumopathy versus infectious bronchitis such as viral, bacterial, parasitic, or protozoal. Further definition is only indicated in case of pertinent clinical signs.
